

Carbon Footprint Dashboard in TAMUQ

Team Members:

Dana El-saafin

Sara Al-Hamad

Amera Jama

Team Mentor & Course Instructor

Dr. Ali Ghrayeb

Dr. Abdlmonem Bietmal

Objectives

- Problem statement
- Proposed solution
- technical standards, constraints and risks
- Performance criteria such as economic, environmental, social, political, ethical, health, safety
- The advantages of our design over its counterpart designs.
- simulation results, visual prototyping and analysis for designed circuits, program code
- Conclusion

Problem Statement

Energy Consumption and
Carbon Footprint

∞

Globally

Global Warming

Climate Change

Qatar

Ranked second World-wide

Texas A&M

Ranked second in QF

Collective Data

Proposed solution

Carbon footprint
dashboard

Recommend
solutions

↓
Monitor the carbon footprint in
TAMUQ

↓
Reduce the carbon
footprint

Carbon footprint dashboard

4/6 main panels
Supply power to Tamuq

Category	subcategory
Plug loads	Computers
	AV equipment
	Servers
	printers
	Peripherals
	others
lighting	CFL light
	fluorescent light
HVAC	AHU
	heaters
	pumps

Excel spreadsheet with all components showing power consumption to calculate the carbon footprint (KgCo2e)

Using Qatar conversion factor = 0.596345388

Dashboard presenting the carbon footprint in Tamuq

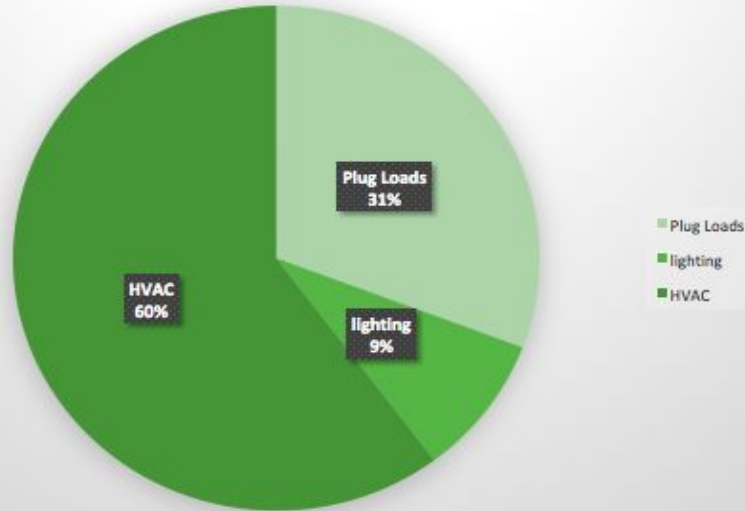

```

Solar inverter production	25231	17653	21161	18224	19333	17124	17321	
HVAC cooling energy consumption	2109684	1549792	1614108	1,644,776	NA	NA	NA	
electrical Total consumption per day in Kwh	19826.9	18869	18679	18478.2	17242.2	17062.6	15802.3	

Proposed solutions

Lighting

1. Replacement with more efficient light bulbs[1]
2. Reduce the number of light bulbs in the building
3. Use light controls: dimmers, motion sensors, occupancy sensors[2]

Plug Loads

1. **Technical solutions:** integrating circuit controls, installing meters and sub-meters ,using Advanced power strips (APS),Installing DC microgrids.
2. **Behavioral Solution:** the first method is raising awareness Campaigns, this can include workshops, newsletters ,emails and regular meetings. Encourage occupant to use equipment recommended by ENERGY STAR

HVAC

- 1.Recommissioning is a process for investigating, analyzing and optimizing the performance of building systems (10-15%) [3.]
2. Collecting occupants temperature preferences [5] then modifying the thermostat temperature to be increased from 18°C to 21°C[6] by taking the average.

Lighting

Example

Category	subcategory	model number	total number	power consumption per unit W	Operating hours	power consumption in Kwh	total power consumption in Kwh	Carbon footprint in kgCo2e
lighting	CFL light	GE Lighting Long Last	250	42 W	24 hr	1.008	252	150.444
	fluorescent light	GE Lighting T5 Long Last	550	80 W	24 hr	1.92	1056	630.43
lighting Modified	LED	Philips	500	58 W	12 hr	0.696	348	207.756
	LED	GE 39283	250	18.5 W	24 hr	0.444	111	66.267
	LED	Osram	550	37 W	24 hr	0.888	488.4	291.57
	LED	Philips	500	58 W	12 hr	0.696	348	207.756

	total power consumption in Kwh	Carbon footprint in kgCo2e
Lighting	1656	988.632
lighting Modified	947.4	565.5978
saved power consumption in kwh	708.6	423.042
saved power consumption in %	43%	43%

HVAC

Changing the temperature from 18°C to 21°C would save 12% of the total power[6]

	total power consumption	total carbon footprint
Plug Loads	5662.74	3380.65
lighting	1656	988.632
HVAC	11094.31	6623.3
changing the temperature from 18 to 21		
HVAC	9762.99	5828.5

Plug loads

A combination of savings strategies demonstrate a 47% reduction in electricity consumption[4].

Total power consumption for plug loads	5662.74
Total power consumption after applying savings strategies	3001.25
percentage can be saved	47%

Total saved power

Plug Load:14.57%

Lighting: 3.87%

HVAC:7.2%

+

Total saved Electricity: **25.64%**

Technical standards, risks, constraints

Technical Standards

Constraints

- ✗ No available smart meters in campus
- ✗ No Authorization for installing smart meters
- ✗ No Real time data

✓ Data Inventory

Risks

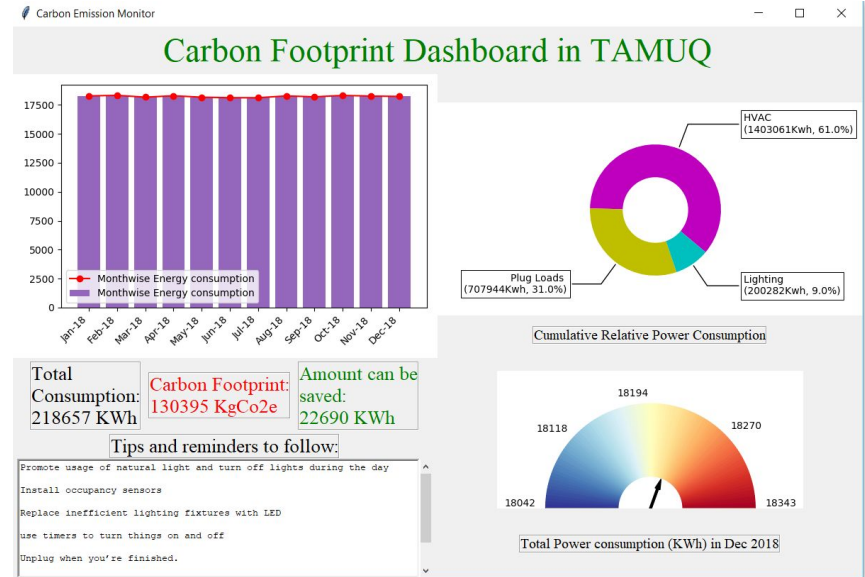

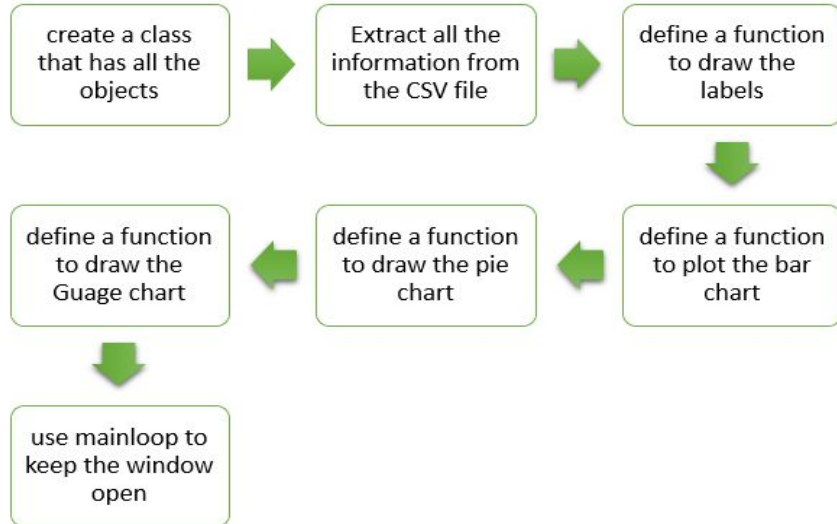

Accuracy

Performance Criteria

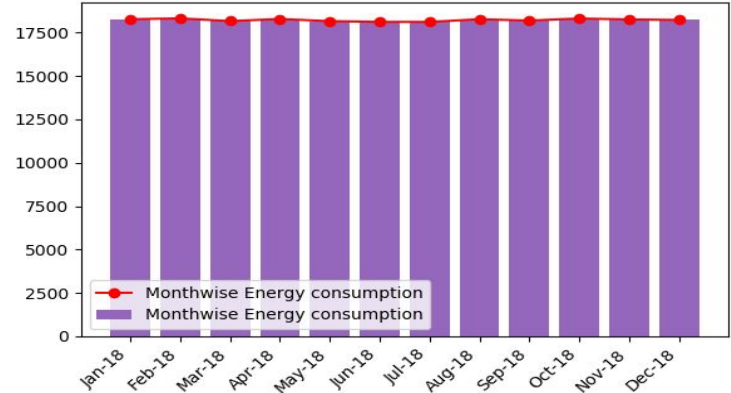

Flow chart of the Algorithm

Program code and Prototype

```

109 axi.legend()
110 # This line rotates the x-axis labels by 45 degrees.
111 axi.set_xticklabels(df_chart['mmM']).tail(bars), rotation=45, horizontalalignment='right')
112 # To pack the layout of the graph. This line will avoid any part of the plot overlapped to each other if smaller window size is used.
113 fig.tight_layout()
114 # Connect a canvas with parent of chartFrame and add the figure object on the canvas
115 self.canvas = FigureCanvasTkagg(fig, master=self.chartFrame)
116 # pack the canvas for the window
117 self.canvas.get_tk_widget().pack()
118 # Finally print the plot on the window
119 self.canvas.draw()
    
```

```

82 def drawlabels(self, args):
83 # These are self explanatory labels syntax including their font style, size, colors, borders etc
84 # padx means the padding distance in pixels on x-axis, pady is the padding on y-axis
85 year_to_show = 2018
86 ttk.Label(self.labelsFrame, wraplength=200, borderwidth=2, relief="groove", text = "Total Consumption:\n"+str(int(self.df_new[self.df_new['year']==year_to_show]['Consumption']))+" KWh",
87 font = ("Times New Roman", 20)).pack(side=LEFT, pady = 5)
88 ttk.Label(self.labelsFrame, wraplength=200, borderwidth=2, relief="groove", foreground = "red", text = "Carbon Footprint:\n"+str(int(self.df_new[self.df_new['year']==year_to_show]['CO2']))+" Kg",
89 font = ("Times New Roman", 20)).pack(side=LEFT, padx = 10, pady = 5)
90 ttk.Label(self.labelsFrame, wraplength=200, borderwidth=2, relief="groove", foreground = "green", text = "Amount can be saved:\n"+str(int(self.df_new[self.df_new['year']==year_to_show]['savings']))+" KWh",
91 font = ("Times New Roman", 20)).pack(side=LEFT, pady = 5)
92
    
```

Total Consumption: 218657 KWh	Carbon Footprint: 130395 KgCo2e	Amount can be saved: 22690 KWh
---	---	--

Tips and reminders to follow:

Promote usage of natural light and turn off lights during the day

Install occupancy sensors

Replace inefficient lighting fixtures with LED

use timers to turn things on and off

Unplug when you're finished.

```

119 self.canvas.draw()
120
121 def drawTextArea(self, args):
122 # creates a Label
123 ttk.Label(self.textFrame, borderwidth=2, relief="groove", text = "Tips and reminders to follow:",
124 font = ("Times New Roman", 20)).pack()
125 # Opens file in read only mode. All the tips and info will be stored there
126 f = open("tips.txt", "r")
127 # creates a text area where the text from the file will be displayed.
128 displayText = ScrolledText(self.textFrame, height=10, width=70, borderwidth = 3)
129 # Text from the file is inserted in the text area
130 displayText.insert(INSERT, f.read())
131 # pack the widget to display it on the window
132 displayText.pack()
133 # uncomment line below if you want the text area to be read only
134 #displayText.configure(state='disabled')
135
    
```

PIE Chart

CODE

```
139 def drawPie(self, *args):
140     # creates a figure object and add subplot
141     self.fig1, ax = plt.subplots(figsize=(6, 3), subplot_kw=dict(aspect="equal"))
142     # Group the actual data equipment wise and sum the consumption for each equipment and copy the result into a temp dataframe

157     # this loop will append the labels into list with percentage values and actual consumption
158     for x in data:
159         temp = round((x/dataSum)*100)
160         newList[i] = equipment[i]+' \n('+str(x)+'Kwh, '+str(temp)+'%'

157     # this loop will append the labels into list with percentage values and actual consumption
158     for x in data:
159         temp = round((x/dataSum)*100)
160         newList[i] = equipment[i]+' \n('+str(x)+'Kwh, '+str(temp)+'%'
161         i=i+1
```

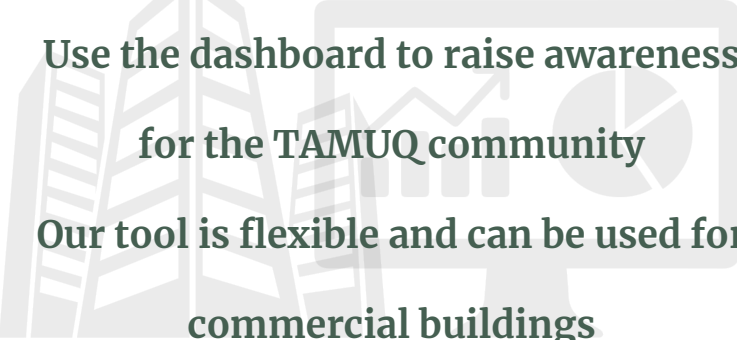

Guage Chart

```
192 font = (TIMES_NEW_ROMAN, 12).pack(pack=...)
193
194 def drawGuage(self, args):
195     # select the minimum and maximum consumption
196     mn = self.df_monthwise['Consumption'].min()
197     mx = self.df_monthwise['Consumption'].max()
198
```

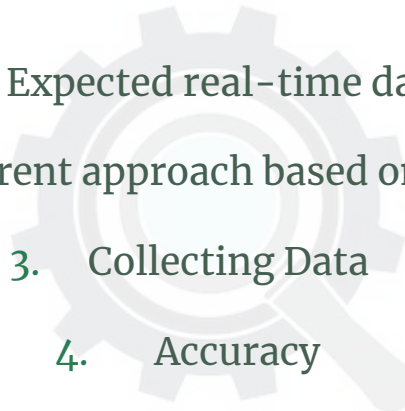

```
207 labels = [''] * len(dial_colors) * 2
208 labels[1] = mx # maximum value to display here
209 labels[25] = int(values_list[75]) # 75% of the max value
210 labels[50] = int(values_list[50]) # 50% of the max value
211 labels[75] = int(values_list[25]) # 25% of the max value
212 labels[98] = mn # display the min value on the left most side
213
```

Advantages

- ◆ Projection for load profile
 - ◆ Use the dashboard to raise awareness for the TAMUQ community
 - ◆ Our tool is flexible and can be used for commercial buildings
- 

Troubleshooting and Experimental Testing

1. Expected real-time data
 2. Selecting a different approach based on the available data
 3. Collecting Data
 4. Accuracy
- 

Summary

- Carbon footprint in Qatar
- Proposed solution
- Advantages
- Prototype
- standards,risks,constraints

Future recommendations & improvements

- Apply smart meters
- Generate real time data
- Real time dashboard
